Note 1: The value of $R_{\theta JC}$ is measured in a still air environment with $T_A=25^{\circ}\text{C}$ and the maximum allowed junction temperature of 150°C . The value in any given application depends on the user's specific board design.

Note 2: The power dissipation P_D is based on $T_{J(MAX)}=150^{\circ}\text{C}$, using junction-to-case thermal resistance, and is more useful in setting the upper dissipation limit for cases where additional heatsinking is used.

Note 3: Single pulse width limited by junction temperature $T_{J(MAX)}=150^{\circ}\text{C}$.

Note 4: The $R_{\theta JA}$ is the sum of the thermal impedance from junction to case $R_{\theta JC}$ and case to ambient.

Note 5: The maximum current rating is package limited.

Note 6: The EAS data shows Max. rating. The test condition is $V_{DS}=32V$, $V_{GS}=10V$, $L=0.5mH$
